

1. Dynamic Websites vs Static Pages vs Single Page Apps (SPAs)

- The video made me realize that different types of websites are designed for different use cases, not just based on complexity but also on how content is delivered. When the video explained static pages, I understood that they are fast and simple because the content doesn't change unless manually updated. The part about dynamic websites made me think about how servers generate content in real time, which is useful for applications like e-commerce or social media. But what really stood out to me was the explanation of SPAs, where content updates without reloading the page, making ^{the} user experience smoother. This helped me connect how modern web apps prioritize speed and interactivity compared to traditional approaches.

2. SPAs vs MPAs/MVC - Are Single Page Apps Always Better?

- This video made me reflect on the common assumption that newer technologies like SPAs are always superior. The part where the video compared BPAs with MPAs using MVC architecture helped me understand that each has its own strengths and weaknesses. I learned that SPAs offer faster interactions after the initial load, but MPAs can be better for SEO and simpler implementations. The discussion about performance trade-offs made me realize that SPAs may not always be ideal for every project, especially if the application is not very complex. This insight changed my mindset from thinking that "SPAs are better" to "it depends on the project requirements".

3. What is a Single Page Application (SPA)

- From this video, I gained a clearer understanding of how SPAs actually work behind the scenes. The explanation that SPAs load ~~the~~ a single HTML Page and dynamically update content using JavaScript helped me ~~better~~ visualize how modern web apps function. The part that described how SPAs reduce page reloads made me think about how why apps feel faster and more responsive. I also learned that frameworks often support SPAs, which simplifies development but also adds complexity. This made me realize that while SPAs improve user experience, they also require careful planning in terms of structure and performance.
